Education

University of California, San Diego – B.S. Computer Science

Graduated: June 2025

Overall GPA: 3.94/4.00

Technical Skills

Coding Languages: Java, Python, HTML, CSS, TypeScript, and SQL

Frameworks: Spring Boot, Spring Security, React, Node.js, JPA/Hibernate, PyTorch, OpenCV

Tools: Git/Github, Docker, Maven, Vite, AWS, Miro, Figma, CI/CD, Postman, Agile

Certifications

AWS Certified Solutions Architect - Associate | Amazon Web Services (AWS)

Date: Oct 2025

AWS Certified Cloud Practitioner | Amazon Web Services (AWS)

Date: Sept 2024

Professional Experience

Cohort Lead/Teaching Assistant

Berkeley Coding Academy

Date: 2023 - Present

- Designed and delivered structured machine learning course materials while collaborating with a team of 5+ tutors to administer course materials to students of various skill levels.
- Simplified complex concepts in machine learning, data processing, and neural networks enabling students aged 10+ to grasp foundational principles and apply them to practical projects.
- Provided personalized 1-1 sessions, developing custom lesson plans to 6+ students based on their needs.

Software Engineer Intern

BlueCloak

Date: 2021

- Worked with a team of 7 interns and 20+ current employees to construct a company-assigned project.
- Engineered a real-time internet traffic generator to simulate realistic data transfers between users and data servers to prepare for possible cyber-attacks.
- Utilized Python with NLTK and SpaCy integration to simulate realistic internet sessions with artificial users.

Projects

HobbyList

Date: 2025 - Present

- Built a full-stack social platform with React/TypeScript and a Java Spring Boot backend using Spring Security, JPA/Hibernate, and PostgreSQL, supporting authenticated users, profiles, milestones, photo uploads, and social relationships.
- Implemented secure JWT-based authentication, password hashing, and email verification with expiring tokens, along with AWS S3 presigned upload/download URLs for scalable and secure media handling.
- Optimized REST APIs and data access via JPA/JDBC tuning, batching, and connection pooling, achieving ~45% faster response times, and ensured reliability through integration and service-layer testing with H2 and MockMvc.
- Designed a personalized activity feed aggregating milestones and recent photo uploads from followed users, leveraging efficient query patterns and pagination to deliver scalable, low-latency social updates.

Pokemon TCG Price Scanner

Date: 2025

- Engineering a full-stack real-time Pokémon card price retrieval app using React, FastAPI, WebSockets, and TensorFlow for live detection, matching, and pricing from webcam input.
- Deployed a custom-trained YOLO-based segmentation model that achieved 99.9% precision with OpenCV and NumPy for efficient in-frame card detection, perspective correction, and visual annotation in live video.
- Implemented a server-side price caching system and RESTful API powered by FastAPI to enable low-latency batch price lookups from the Pokémon TCG API; reducing API load by 70% and response latency by 60%.
- Built a scalable Python WebSocket backend for real-time frame ingestion and model inference, integrated with a React/Vite frontend, achieving a ~100ms detection-to-price latency across devices.

Root Journal

Date: 2024

- Led a team of 10 developers in creating a journaling web application using Agile methodologies and sprints.
- Detailed timelines, design sketches, and wireframes through Miro and Figma while planning meetings.
- Utilized Quilljs in order to have built-in document editing features such as text size, font, color, and lists.
- Leveraged CSS and JavaScript to visually animate the growth of a root over a year with low performance impact while storing 1,000s of journal entries per user.
